RE: Statement Regarding Water Odor

Contact Robert Jackson, 269-7978 or Brenda Thornton, 269-7819

The Sewerage and Water Board of New Orleans said today that a musky odor and taste in the city's water supply are caused by an algae problem in the Mississippi River, where conditions at this time are conducive to algae growth.

Board Officials Emphasized That The Situation Presents No Health Problems To Customers.

Algae is not present in the water system, but natural compounds produced by the algae are responsible for the taste and odor. These harmless compounds are found at extremely low levels. The Sewerage and Water Board is continually monitoring the situation and adding activated carbon to the treatment process. However it is unlikely that the problem will be completely alleviated until water conditions improve in the river.

The Board has received several calls from customers reporting the taste and odor. Board officials said some individuals are more sensitive than others to ultra-low levels of compounds responsible for taste and odor.

Taste and odor problems from algae growth are common for communities along the river. New Orleans experienced similar occurrences in 1991, 1997, 1999, and 2005.
